Influence of Rare Earth Elements on Microstructure and Mechanical Properties of Cast High-Speed Steel Rolls

Wang Mingjia (王明家)^{1*}, Mu Songmei (穆松梅)², Sun Feifei (孙菲菲)^{1,3}, Wang Yan (王艳)¹

(1. State Key Laboratory of Metastable Materials Science and Technology, Yanshan University, Qinhuangdao 066004, China; 2. Experiment Center, Northeastern University in Qinhuangdao, Qinhuangdao 066004, China; 3. Yanming Alloy Roll Co. Ltd., Qinhuangdao 066004, China)

Received 29 November 2006; revised 16 May 2007

Abstract: The influence of rare earth (RE) elements on the solidification process and eutectic transformation and mechanical properties of the high-V type cast, high-speed steel roll was studied. Test materials with different RE additions were prepared on a horizontal centrifugal casting machine. The solidification process, eutectic structure transformation, carbide morphology, and the elements present, were all investigated by means of differential scanning calorimetry (DSC) and scanning electron microscopy energy dispersive spectrometry (SEM-EDS). The energy produced by crack initiation and crack extension was analyzed using a digital impact test machine. It was found that rare earth elements increased the tensile strength of the steel by inducing crystallization of earlier eutectic γ -Fe during the solidification process, which in turn increased the solidification temperature and thinned the dendritic grains. Rare earth elements with large atomic radius changed the lattice parameters of the MC carbide by forming rare earth carbides. This had the effect of dispersing long-pole MC carbides to provide carbide grains, thereby, reducing the formation of the gross carbide and making more V available, to increase the secondary hardening process and improve the hardness level. The presence of rare earth elements in the steel raised the impact toughness by changing the mechanism of MC carbide formation, thereby increasing the crack initiation energy.

Key words: eutectic carbide; impact toughness; differential scanning calorimetry; high-speed steel roll; rare earths
CLC number: TG142.4; O621.25 **Document code:** A **Article ID:** 1002-0721(2007)04-0490-05

High-speed steel rolls have been developed considerably in recent years^[1-4]. Compared to traditional rolls, cast high-speed steel rolls used in hot-strip mill F1-F6 work rolls display excellent abrasion resistance, improved quality of products, and reduced rolling costs, and are therefore considered to find potential application in the production of cold-rolling steel rolls.

The type, shape and quantity of carbide formed are the key factors for controlling the quality of the

centrifugally cast high-speed steel rolls, and these factors are directly related to wear resistance, thermal fatigue resistance, surface roughness resistance, frictional coefficient, and rolling load. Therefore, precise control of carbide properties is fundamental for realizing effective high-speed steel roll production. Rare earth elements with high chemical activity have both deoxidizing and desulfurizing capability, and these processes known to influence the solidification process of high-speed steel are still present in the liquid metal state.

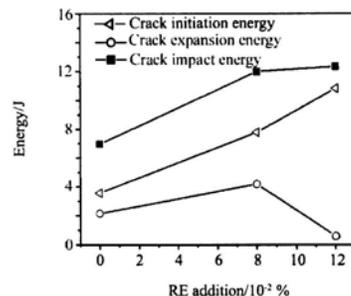

Fig. 7 Influence of rare earth elements on impact energy

3 Conclusions

1. Rare earth elements improved the tensile strength. Thin rare earth inclusion induced the crystallization of earlier eutectic γ -Fe as a nonuniform core, increased the crystallization temperature of the γ -Fe dendritic grains slightly, and caused them to become thin.

2. Rare earth elements made the long-pole shaped MC carbide into tree-like grains, and transformed them to disperse grains of the carbide. Rare earth elements with large atomic radius changed the lattice parameters of the MC carbide by forming rare-earth carbides, thereby limiting the growth along the pole and subsequent formation of uniformly-dispersed grains. The number of gross carbide grains was reduced, causing more V element to dissolve within the matrix, thereby increasing the secondary hardening effect and hardness level.

3. Rare earth elements enhanced the toughness of cast high-speed steel mainly by altering the shape of the MC carbide and increasing the crack initiation energy.

<p>Earthquake prediction research of the last decade has produced many observations of precursory phenomena, but the reliability of their physical correlation to the subsequent earthquake is often debatable, and, in any case, very little can be inferred concerning the underlying coupling processes. As precursors are only a small subset of the large family of crustal 'transients' (earthquakes swarms, fluid instabilities, episodic fault creep,...), and as the latter are generally very poorly understood, it is clear that any progress in short-term prediction requires to study and model these transients. A significant advantage of this approach is that transients are much more common than precursors, and are thus easier targets for well-focussed experiments. I propose to consider a broader conceptual framework of a generalized self-organized critical model for the crust, where the interacting instabilities leading to distribution power laws are not only earthquakes, but also transients. Such a model implies a significant coupling and cross-triggering between both inertial and slow instabilities. Our future ability to detect transients and to model the 'transient-to-earthquake' triggering processes will be the key for assessing the predictability of earthquakes. © 2001 Elsevier Science B.V. - “在编文章”(Articles-in-press, AiP): 已经获得期刊接收, 但还未正式出版的论文, 在文献正式出版前4个月获得.
- 目前有3000种, 来自Elsevier, Springer, Karger Medical, Scientific Publishers, Nature Publishing Group(NPG).
- 即将增加BioMed Central和IEEE出版的期刊.

Scopus – 写作投稿的辅助工具

- 洞悉研究热点和趋势
- 寻找潜在的合作伙伴
- 确定有效的投稿策略
- 建立自身学术影响力

FGF-16 is required for embryonic heart development
(2008) *Biochemical and*

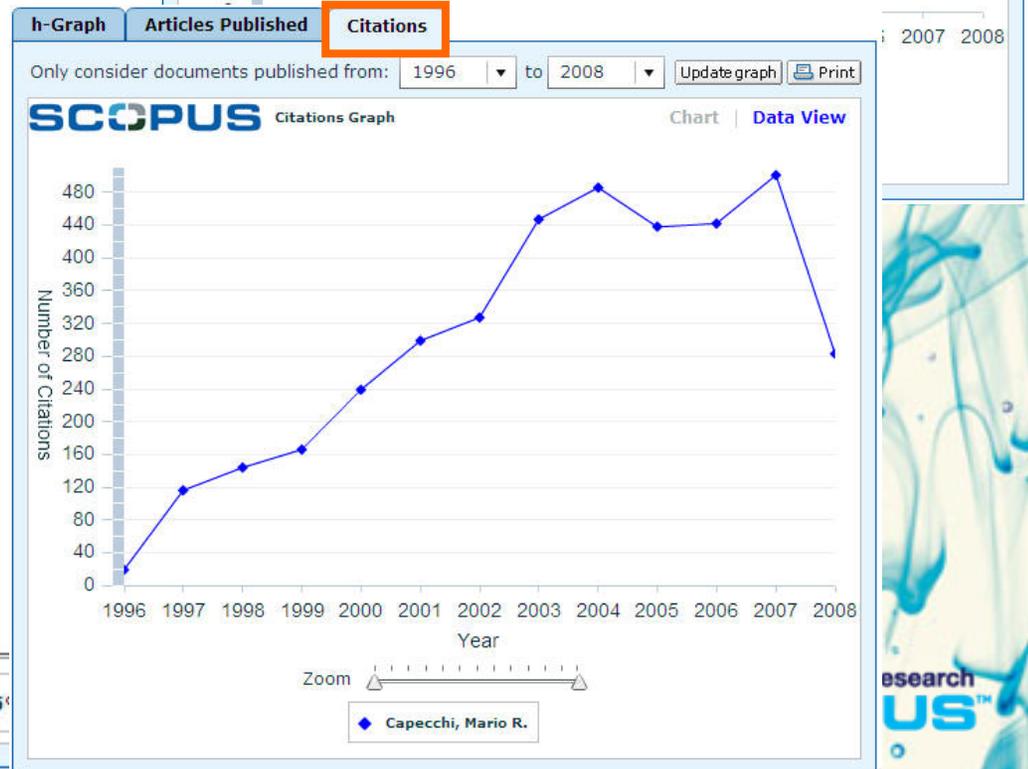

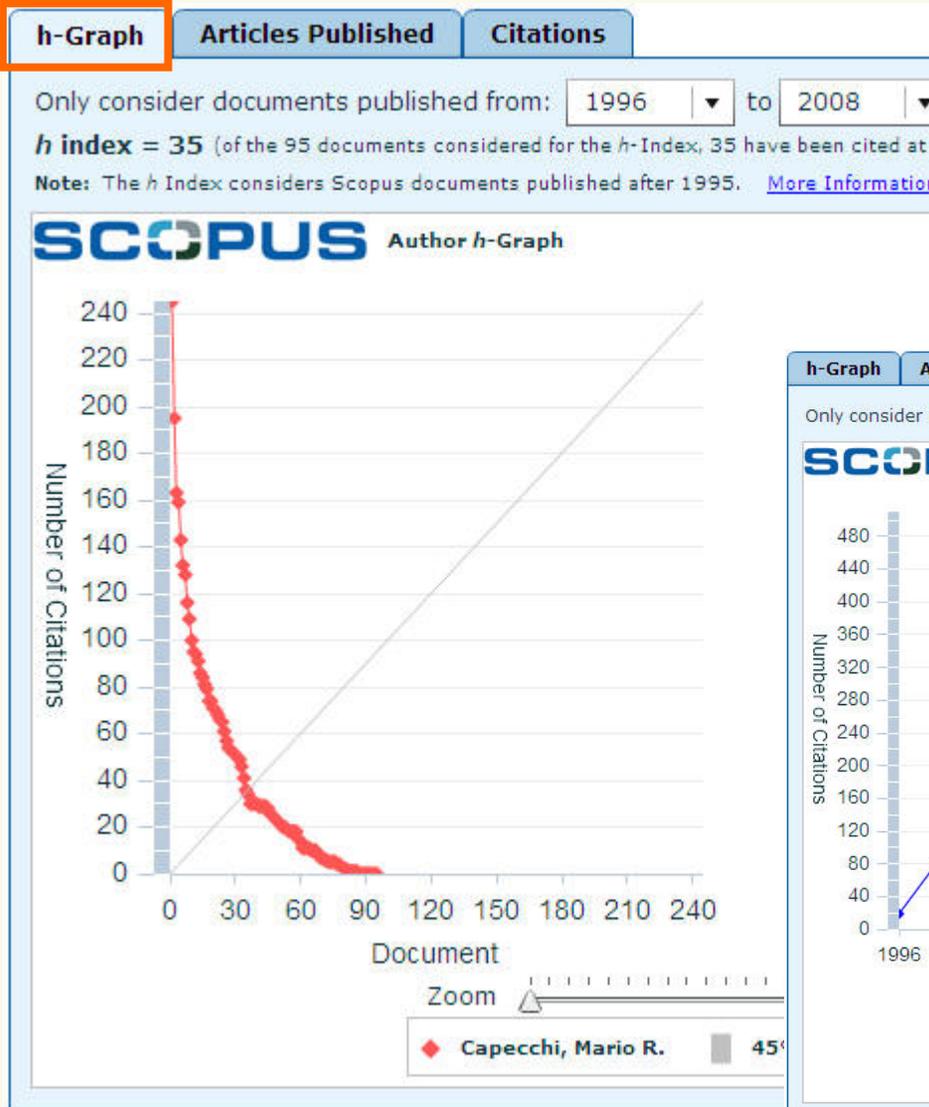

研究者个人的科研产出评价--H指数

- 传统评价体系的基础—期刊影响因子
 - 对期刊的评价指数，不适用于人
 - 高影响因子的期刊存在低被引甚至零引用论文
- H指数--关注个人的科研产出数量与质量（被引频次）
 - 2005年由加大圣迭戈分校物理教授Jorge Hirsch提出
 - 一位科学家的指数为h，意味着在他的 N_p 篇文章中，有h篇文章至少被引用h次，另外 (N_p-h) 篇文章被引少于或等于h次

1	2	3	4	5	6	7	8	9	10	11

The screenshot shows the Scopus website interface. At the top left is the 'SCOPUS' logo. To the right are links for 'Register' and 'Login'. Below the logo is a navigation bar with buttons for 'Search', 'Sources', 'Analytics', 'My Alerts', 'My List', and 'My Profile'. On the right side of the navigation bar are icons for 'Live Chat', 'Help', and 'Scopus Labs'. A banner below the navigation bar reads 'NEW: Scopus launches the Scopus Journal Analyzer to compare the performance of your journals. Read more...'. To the right of the banner is the text 'Brought to you by Scopus Team' and a 'Library catalogue' link. The main search area has four tabs: 'Basic Search', 'Author Search', 'Affiliation Search' (highlighted with a red border), and 'Advanced Search'. Below the tabs is a search form with a 'Search Tips' link. The form has a label 'Affiliation:' followed by a text input field containing 'university of liverpool'. Below the input field is a hint: 'E.g., university of toronto'. At the bottom of the form are 'Search' and 'Clear' buttons.

The screenshot displays the Scopus TopCited website interface. On the left, there are two filter sections: 'Subject area' with a dropdown menu set to 'Chemical Engineering', and 'Publication period' with a dropdown menu set to 'Last 5 years (2004 - 2008)'. Both sections are circled in orange. The main content area on the right is titled 'TOP 20 cited articles in Chemical Engineering (2004 - 2008)' and includes an RSS icon. It lists four articles with their titles, authors, journals, and citation counts.

The right side of the slide features a large, abstract graphic of a human head profile in shades of blue and teal. The head is composed of various lines, dots, and circular patterns, suggesting a network or data structure. In the bottom right corner, the text "refine your research" is written in a small, dark font, with "SCOPUS™" in a larger, bold, blue font below it.
